**Comments**

Full profile generated:

- out of 9 loci, 14/17 (82%) alleles were identical to Jurkat, Clone E6-1 (ATCC: TIB-152)
- this is consistent with genetic drift over passaging, within the scientific literature samples are usually thought to match if >80% of alleles are identical
- please note also that Jurkat is known to be genetically unstable in culture and the profile generated here is consistent with STR alterations that have been published for this line
